

# QUALI ANIMALI VIVONO NEL MARE?

Troviamo

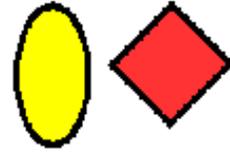

animali marini

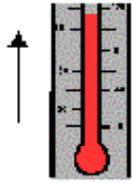

diversi

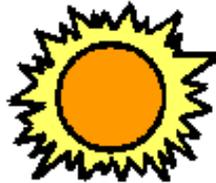

quando

cambia

la temperatura,

la luce,

la presenza di sale, e la pressione

dell' acqua

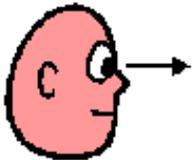

del mare.

Nella riva

sabbiosa

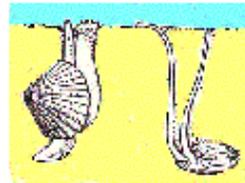

vediamo

granchi

e sotto

la sabbia,

vongole

e cannicchi.

Nella roccia

vivono

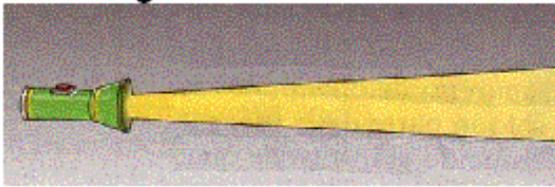

patelle

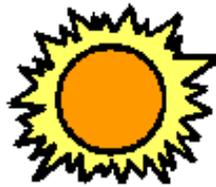

ricci di mare, e cozze.

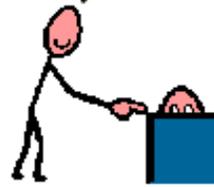

Immergendoci nella zona litorale, dove l'acqua è ancora

illuminata

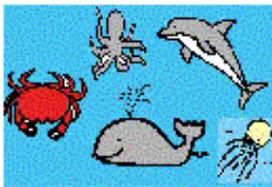

dal sole,

troviamo

moltissimi

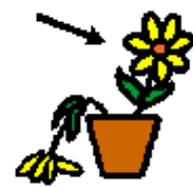

animali marini e alghe.

alghe.

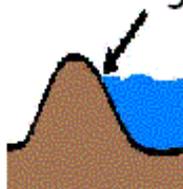

Sardine, acciughe

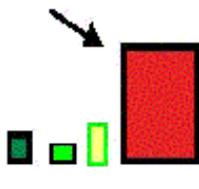

vivono

lontano

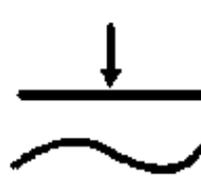

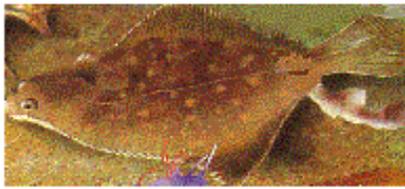

dalla riva

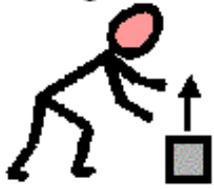

in grandi

gruppi.

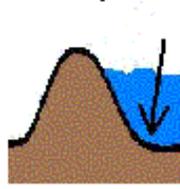

Sogliole e rombi, hanno il corpo piatto e non

si staccano

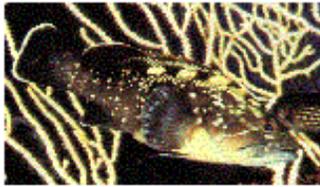

mai

dal fondo marino

sabbioso.

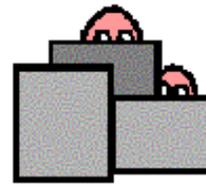

Cernie,

murene,

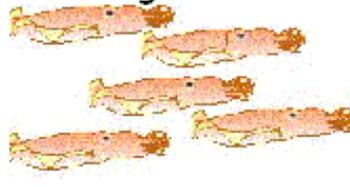

e gronchi

si nascondono

in tane tra le rocce.

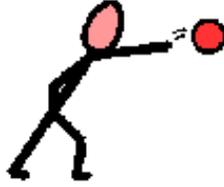

Seppie

polpi,

si muovono

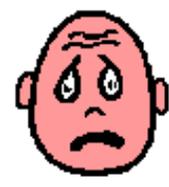

lanciando

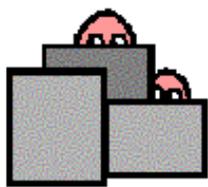

getto d'acqua,

e quando

sono impauriti

cercano di nascondersi

schizzando

inchiostro.

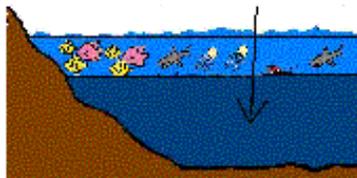

Troviamo anche granchi e gamberi, paguri,

pesci colorati, grandissimi animali

come le balene, e i capodogli.

Nelle profondità del mare, dove non arrivano la luce e il calore

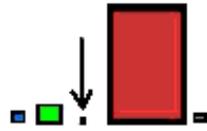

del sole, vivono strani pesci mostruosi e gamberi.

Gli animali del mare, come la balena, si nutrono di placton,

insieme di

piccoli

animali

e vegetali ;

le salpe

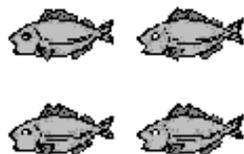

si nutrono

di alghe ;

gli squali

sono carnivori .
